

Zetafax in an application server environment

The Zetafax client can be deployed quickly and easily to multiple network users using software installed and running on application servers including Windows Server Terminal Services, Citrix MetaFrame XP and Citrix Presentation Server 4.0.

Simpler deployment

When used in an application server environment, Zetafax is quick and easy to deploy as it is not necessary to install it on every client device. Network faxing capabilities can be provided to LAN and remote users and to branch offices via a single copy of the Zetafax client on the application server.

Upgrades are fast and simple too. By upgrading the Zetafax client software on the application server, administrators can ensure that each Zetafax user automatically runs the latest version, eliminating the need to upgrade every desktop.

Easy account configuration

New user accounts can easily be set up on the network. Users have their own personalized settings for the Zetafax client as well as private in-boxes and out-boxes, which can be protected by using file server permissions.

Cross platform support

Using MetaFrame and the Citrix ICA client, the Zetafax client can be used in an application server session on a wide range of operating systems including Macintosh, UNIX, Handheld PCs and Network Terminals.

Easy to use, wherever you are

Using a Zetafax client on an application server, network users can be fax enabled in branch offices or at remote sites. Remote users can utilize Zetafax using existing thin client sessions over a wide area network or even remote access.

For fax broadcasting or other large volume faxing, Zetafax supports embedded addressing in the application server environment, meaning easier, faster fax addressing.

Benefits

Enables faxing from applications running in a Terminal session as well as from applications running locally

Makes deployment of Zetafax fast and simple company-wide by installing the client software once on the application server computer

Provides faxing capabilities to remote users and users in branch offices

Central management and deployment helps reduce overheads during installation and upgrading

Mix and match - Zetafax client runs on thin and rich clients

Support for mixed desktop environments

The Zetafax client can work seamlessly in a mixed desktop environment. By installing the Zetafax client on the local computer, users can submit faxes from an application on an application server client, as well as from an application on the local PC.

Recommended set-up

The Zetafax server should be installed on a dedicated server PC separate to the application server. The Zetafax client should be installed onto the application server along with other user applications. Alternatively, the client can be installed directly onto desktop computers to support a mixture of "thin" and "rich" clients.
